I'll review the landing-page specifications and current frontend, then propose a scoped implementation plan with dependencies, open decisions, and verification steps. I won't change any files.

```
• Ran pwd; rg --files -g 'AGENTS.md' -g 'README.md' -g 'package.json' -g '*ui-
spec*' -g '*user-flows*' -g '*architecture*' -g '*iteration*' -g '*Iteration*' -g
'*landing*' -g '*global*' ..
  └ ../docs/ui-spec.md
    ../frontend/README.md
    ../frontend/package.json
• Ran cat ../AGENTS.md ../README.md ../frontend/package.json
  └     "vitest": "^5.0.3"
      }
    }
• Ran cat ui-spec.md user-flows.md architecture.md
  └ - `docs/design/user-flows.md` — player, group, and staff journeys and state
transitions.
    - `docs/security.md` — security/privacy specification **if the team has created
it**.
    - Root `AGENTS.md` — instructions for coding agents and development
verification.
• Failed (exit 2) git -C .. status --short; rg --files ../frontend ../.github
docs .  -g '!package-lock.json' -g '!node_modules' -g '!\.git'
  └ ../frontend/src/index.css
    ../frontend/src/App.test.tsx
    ../frontend/src/main.tsx
• Ran cat ../frontend/src/App.tsx ../frontend/src/App.css ../frontend/src/index.css
../frontend/src/main.tsx ../frontend/src/App.test.tsx
../frontend/vitest.config.ts ../.github/workflows/ci.yml; sed -n '1,85p' …
  └ These gaps are explicit review items. A developer or agent should not silently
decide them.
    ../frontend/src/index.css:14:  --sans: system-ui, 'Segoe UI', Roboto, sans-
serif;
    ../frontend/src/index.css:15:  --heading: system-ui, 'Segoe UI', Roboto, sans-
serif;
```

The frontend is still the starter screen: there's no router, shared CAC component library, or CAC branding assets. The specs define the landing-page structure, but leave exact design tokens and Learn/Donate URLs unconfirmed. The plan will identify those dependencies explicitly.

```
• Browsing the web
• Opened https://www.figma.com/make/lcvu8JNOpipCLAhd4DYNeF/Poverty-Simulation-
Prototype?t=EmcKq5m8zlKgpXIv-20&fullscreen=1
```

Repository review is complete. No files were changed, dependencies installed, or implementation started.

Findings

- App.tsx (/home/roger/Documents/GitHub/team6310/frontend/src/App.tsx) renders the starter counter. No router, CAC shared components, or CAC branding assets are present.
- UI specification (ui-spec.md) specifies a CAC header, introductory label, headline "One month. Real trade-offs. No simple answers.", explanatory copy, Play Simulation action, and a separate 30-day overview card.
- User flows (user-flows.md) directs Play to Introduction. Exact route paths and approved Learn/Donate destinations remain unspecified.

- The linked Figma prototype was inaccessible through the available browser tool. I cannot verify its visual details or approval status.
- Vitest and React Testing Library are configured; the existing test covers only the counter. The inspected CI workflow runs formatting, lint, TypeScript, tests, and build checks.

Proposed implementation plan

1. **Confirm the implementation inputs.** Resolve the design and navigation decisions below, then record approved details in the UI/flow specifications.
2. **Integrate frontend foundations.** Reuse the global-setup router, layout, navigation, and action components when available. If this task should establish those foundations instead, obtain explicit scope approval first.
3. **Build the landing page.** Add `frontend/src/pages/LandingPage.tsx` and associated styles. Include approved CAC branding and copy, the specified headline, fictional-household explanation, and 30-day card.
4. **Distinguish the three actions.** Proposed hierarchy: filled primary Play action, secondary Learn About CAC link, and separately styled Donate link. Use native navigation links with clear labels and hover, focus, and active states; confirm styling against the approved design.
5. **Implement responsive accessibility.** Place introduction and overview side by side on desktop and stack them on narrow screens. Keep all actions visible and usable, with semantic landmarks, logical heading order, visible keyboard focus, appropriate image alternatives, readable text, and verified contrast.
6. **Connect approved destinations.** Wire Play to the Introduction route and Learn/Donate to their confirmed destinations. Coordinate with destination-page owners so acceptance does not depend on broken links or placeholder pages.
7. **Verify and document.** Replace the obsolete counter test, add landing/navigation coverage, complete browser checks, and document the final routes and approved design decisions.

Likely affected files: `App.tsx`, `App.css`, `index.css`, `App.test.tsx`, new landing-page files, approved branding assets, and UI/flow documentation. Router/shared-component files depend on the global-setup decision. Package files change only if an approved routing dependency is needed.

Decisions needed before implementation

Decision	Why it matters
Approved Figma version, logo/assets, final copy, palette, typography, and responsive behavior	The written specification leaves visual details unconfirmed; exact design matching cannot yet be assessed.
Global-setup deliverable and router ownership	The task assumes routing and shared components that are absent from this checkout.
Play route and Introduction-page availability	The destination is specified conceptually, but no route or page exists.
Learn destination: CAC website or internal information page; official donation URL	The task allows an informational page, while the specifications require approved destinations. An internal page would add content and scope.

Decision	Why it matters
Employee Admin visibility	The specified public header includes it, but staff functionality is later scope. The landing-page treatment needs a team decision.

Please provide or confirm these decisions and the applicable iteration acceptance criteria before implementation.

Verification after authorization

Run `npm run format:check`, `npm run lint`, `npm run typecheck`, `npm run test`, and `npm run build` from `frontend/`. Test all three destinations and keyboard navigation. Inspect desktop, tablet, and mobile layouts, including 320px width and zoomed text, for overflow, overlap, contrast, focus visibility, missing assets, and browser-console errors.

No tests were run during this planning-only review. Implementation remains stopped as requested.
